

OpenClay

intention → infrastructure

The local-first AI agent bootstrapper built for the post-leak world.
No subscriptions. No API costs. No rate limits. No third-party downtime.
The better your hardware, the more powerful it gets.

What Is OpenClay?

OpenClay is an open-source, fully local AI agent system that turns your goals into running infrastructure — on your machine, under your control, forever.

It was built during the same week Anthropic accidentally leaked 512,000 lines of Claude Code's source code, the internet did a clean-room rewrite in two hours, and 136,000 developers suddenly realized the agentic future doesn't have to be locked behind a subscription.

OpenClay is what that community needs next: a bootstrapper that installs local agent tooling, configures it for your hardware, and wraps it in a goal-oriented pipeline that just runs.

You drop an intention. OpenClay builds the infrastructure.

Why Now

The `claw-code` moment proved the demand is real. 136,000 stars. 102,000 forks. The fastest-growing repo in GitHub history.

What that community has: a DMCA-proof, model-agnostic agent harness. MIT licensed. Runs on anything.

What that community still needs: a goal-oriented layer that tells the agent *what to actually do*, configures it for local hardware in one command, and connects it to real-world publishing workflows.

That's OpenClay.

Works With

- **Claw Code** — the open-source Claude Code rewrite (recommended)
- **Claude Code** — if you have an Anthropic subscription
- **Ollama directly** — zero agent harness, pure local inference

What It Does Today

Fast Court Tennis Demo — Live Instagram Carousel Automation:

1. Drop tennis photos into the panel
2. Local vision model (llava via Ollama) analyzes the images on your machine
3. Generates a branded Instagram caption + hashtags — no API call, no cloud
4. Posts the carousel directly to Instagram via Meta Graph API
5. Everything happened on your hardware. Zero cost per post. Forever.

This is the proof-of-concept. The pattern scales to any content workflow, any brand, any goal.

The Stack

Quick Start

1. Install Ollama

```
# macOS
brew install ollama

# or: ollama.com/download
```

2. Pull local models

```
ollama pull llava      # vision (4.7GB)
ollama pull qwen2.5    # text/caption
```

3. Clone OpenClay

```
git clone https://github.com/openclay/openclay
cd openclay
pip install -r requirements.txt
```

4. Configure .env

```
cp .env.example .env
# Add your Meta App credentials for Instagram posting
# Everything else runs local – no other keys needed
```

5. Run

```
python panel.py
# Open http://localhost:8888
```

6. Connect Instagram (one-time)

Click **Connect Instagram** → complete Facebook OAuth → done.

Hardware

Setup	Performance
MacBook M3/M4	Excellent — Metal GPU, fast inference
MacBook M1/M2	Great — fully capable
PC with NVIDIA RTX	Fast — CUDA acceleration
Any machine with 16GB RAM	Works — CPU inference, slower

No minimum spec. Better hardware = faster agents = better output. The ceiling scales with you.

vs. Everything Else

	OpenClay	Claude Code	Buffer / Later	Zapier
Runs locally	✓	✗ (cloud)	✗	✗
Cost per post	\$0	Subscription	\$15–\$65/mo	Per task
Vision analysis	Local Llava	Cloud Claude	✗	✗
Model-agnostic	✓	✗	✗	✗
You own the code	✓ MIT	✗	✗	✗
Works offline	✓	✗	✗	✗

Roadmap

- [] Claw Code integration — one-command install for claw-code + OpenClay together
- [] Multi-platform posting — Facebook, X, LinkedIn
- [] Scheduled queue — post at optimal times, agent decides
- [] KAIROS-style memory — persistent brand context that improves captions over time
- [] Discord interface — type a goal in Discord, agents execute overnight
- [] Fine-tuned caption model — per-brand voice trained locally
- [] Auto-ingest — watch a folder, post automatically

Philosophy

The claw-code event made something explicit that was already true:

The code is a byproduct. The coordination system is the product.

OpenClay is not a collection of scripts. It is an architecture for turning human intention into autonomous agent execution — entirely on hardware you own, with models you control, producing results you publish.

The era of paying a subscription to rent someone else's compute to do something your own machine could do better is over.

Contributing

OpenClay is MIT licensed. PRs welcome. The community around local-first agentic tooling is forming right now — this is the right moment to be part of it.
